Being a part of Supaplex, you will realize that you are in the world .This invention relates to electrical test devices, and more particularly to an electrical test device which test the continuity of a substantially elongated cable which is connected at both ends to an electrical source and to a load. Heretofore, cable continuity test systems are disclosed in, for example, U.S. Pat. Nos. 3,710,500; 3,765,802; 4,097,462 and 4,525,924. Such systems generally comprise a plurality of test leads in communication with the cable, a pair of electrical energy sources, and a probe. As the cable is connected at both ends to the electrical energy sources and to the load, there is a voltage drop across each of the leads. The pair of electrical energy sources are typically DC voltages in the 200 to 800 V range. The probe can be of the capacitive type or the resistive type. In the case of the resistive type, the probe is simply placed on the cable and a voltage is applied to the probe to test for the continuity of the cable. In the case of the capacitive type, an alternating voltage is applied to one of the probes, and the voltage is sensed at the other probe. If the leads are not connected at both ends to the cable, the capacitor cannot be charged, and so it is not able to test for cable continuity. In the case of a DC voltage, the capacitance becomes too great to test for continuity. As mentioned above, the electrical energy sources are of high voltage and can cause difficulty in the operation of the circuitry. The present invention provides an improved cable continuity test device which can be applied to cables of different lengths and different diameters, which can be activated without requiring the cable to be in an electric circuit, and which can safely operate at the voltages required. Accordingly, the invention comprises: an electrical continuity tester comprising: a substantially elongated f30f4ceada
