The combination of endoscopic retrograde cholangiopancreatography (ERCP) and pancreatoscopy. A prospective study was conducted on 25 consecutive patients with pancreatic and/or biliary disorders requiring an endoscopic procedure. This consisted of pancreatoscopy (n = 25), pancreatography (n = 20) and ERCP (n = 22). Pancreatoscopy was performed using a catheter through the working channel of the duodenoscope in 18 patients and through a combination of the duodenoscope and a standard endoscope in 7 patients. The combination of ERCP and pancreatoscopy permitted more detailed evaluation of the pancreatic duct and its proximal end. The duodenal papilla was clearly identified in 18 out of 25 cases. In 13 patients the papilla could be traced into the orifice of the main pancreatic duct. The brush technique was used in all patients and the diagnostic yield was 100 per cent. There were no complications and the procedure provided a definitive diagnosis in all patients. We conclude that the combination of ERCP and pancreatoscopy is a safe, definitive and highly effective method of evaluating the pancreas. I once played a game of "do you think..." with my 4 year old. He had a game of "do you think" in the car. It was a simple game. He would say something, and you would then have to say "yes", "no" or "don't know". In the end, he'd scream "EVERYONE SAY YES!" and I'd have to stop the game. So anyway, I was playing it with him the other day, and he was telling me that "no" was always an option. And he was asking me if that was always the case, and if I'd ever played the game and said "yes" in the past. See, it would be different if he were trying to tell me something that he couldn't ask me. But he was asking me what he thought, and what he thought was that I'd say "yes" and he didn't think it was always an option. So he asked me. So I told him, "yes" in the past. He asked how many times, and I
